AUTHORS: Gertsriken, S. D., Slyusar, B. P.

TITLE: Formation energy of thermal vacancies in metals

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 11, 1962, 5, abstract 111⁴⁵
("Nauk. zap. Kyiv's'k. un-t", v. 18, no. 3, 1959, 119 - 129, Ukrainian; summary in Russian)TEXT: The vacancy formation energies E_d were determined in Au, Cu, Ag, Al, Zn and Pb by the electric resistance method and in Al, Zn and Pb by the dilatometric method. It is shown that $E_d/E_{sd} \approx 1/3$, where E_{sd} is the activation energy of selfdiffusion. The obtained E_d values are in a fair agreement with those calculated theoretically for Ag, Au and Cu and also with the available experimental data for some of the above elements. The relative number of vacancies near the melting point is calculated for some elements.

 Determination of allotropic-transformation heat in titanium, zirconium and the alloy
 $Ti + 6.5\% Cr$
 Ukrayins'kyi fizichnyy zhurnal, v. 7, no. 4,
 1962, 439-442

TEXT: Allotropic $\alpha \leftrightarrow \beta$ transformations in titanium, zirconium, and the alloy $Ti + 6.5\% Cr$ were investigated. It is noted that in technical literature there are only very few studies on the allotropic-transformation heat of these metals. The authors determined the transformation heat by the differential calorimeter method. Thereby, two specimens (the differential-starter rate (6 deg./min.). The specimens, which arises as a result of absorption or heat

Card 1/3

Determination of allotropism...

release due to the $\alpha \rightarrow \beta$ transformation, is measured by a differential thermocouple. The alloy specimen can be used as a standard for the pure titanium, after it underwent the transformation. The specimens were 19 mm in diameter and 50 mm long. The curve temperature-difference of specimens as a function of temperature is shown (the readings of the thermocouple being in millivolts); (the temperature ranged between 0 and 900°C). The allotropic-transformation heat of titanium was 795 ± 70 cal/mol, that of the alloy Ti + 6.5% Cr was 450 ± 50 cal/mol, and of zirconium--712 + 60 cal/mol. The obtained values were in good agreement with the results of other investigators. It is noted that the above method is sufficiently accurate and simple. It can be used in a number of cases, although its applicability is limited by the type of material investigated (the metal and the alloy should have similar specific heat). There are 2 figures, 1 table and 9 references. 4 Soviet-bloc and 5 non-Soviet-bloc. The references to the English-language publications read as follows: K. K. Kelley, "S. Bur. Mines Bull. 676, 1949; X

TABLE I BOOK INFORMATION 307/1572

Industrial Production: mathematical and programming methods for production planning of heavy industry [Russian translation] [Moscow] Naukova Dumka, 1979. 299 p. 5,000 copies printed.

Author: Mat' A.M. Author: Candidate of Technical Sciences; Dr. I. N.S. Chernovs.

Title: Mat' A.M. Chernovs.

Publisher: State publication of articles is intended for workers and technical personnel of the metallurgical industry.

Comments: The book contains principal trends in the utilization of unused production capacity of existing building plants and indicates ways to realize these resources. On the basis of examples drawn from the practice of leading plants of the corporation, the authors show how to utilize this unused capacity by applying the following measures: improvement of the productivity and efficiency of existing equipment; reworking the shape and size of blanks closer to the shape and dimensions required; partial replacement of mechanical machining with cold forming; improvement of the efficiency of existing technological processes and introduction of new ones; and a comprehensive mechanization and automation of heavy industry. The problem of utilizing unused capacity in the construction of heavy industry is dealt with separately. No recommendations are mentioned.

AUTHOR: Nemets, O. F.; Pikar, F.; Slyusarenko, L. I.; Tokarevskiy, V. V.

TITLE: Elastic scattering of deuterons by strontium and tin isotopes

SOURCE: Zh. eksper. i teor. fiz., v. 46, no. 5, 1964, 1900-1901

TOPIC TAGS: strontium, tin, deuteron, elastic scattering, angular distribution, diffraction pattern

ABSTRACT: The elastic scattering of 13.6-MeV deuterons by strontium and tin isotopes. Measurements in the angle range 10° -- 150° were made with a selective scintillation spectrometer. The strontium targets were polystyrene films impregnated with SrCO₃. In the angle region 0° + 30° , the peaks corresponding to elastic scattering by the strontium could be separated reliably from the peaks corresponding to the elastic scattering by carbon and oxygen. The tin targets were free-standing foils 3 -- 4 mg/cm² thick with 90% enrichment. In the region of angles larger than 25° the angular distributions of Sr have a clear out diffraction structure, which changes little on going from isotope to isotope. The angular distributions obtained for the tin isotopes are in good agreement with those of N. Cindro

Card 1/3

ACCESSION NR: AP4037607

and N. S. Wall for natural tin at 13.5 MeV (Phys. Rev. v. 119, 1340, 1960). On all the tin isotopes one observes a clear out diffraction structure, with no noticeable difference in the cross sections for the different isotopes. From the comparison of the elastic scattering of deuterons by tin at 15, 13.6 and 11.8 MeV it is concluded that the diffraction structure becomes more clearly pronounced with increasing energy and shifts towards the smaller angles.

Authors : Slyusarenko, N. T.

Title : An experiment in turn threading of large buttress screws

Periodical : Vest. mash. 36/1, 42-45, Jan 1956

Abstract : A description is given of a turning head design constructed by the Laboratory of Metal Cutting at the Novo-Kramatorsk Machine Construction Plant im. Stalin, for cutting threads on large-size buttress screws. Methods of cutting as well as the construction and configuration of the turning head and cutting tools are given. Table; drawings.

TITLE: Use of the Skip Hoists of Lines for the Delivery of Poor Ores
(Ispol zovat' skipovyye podzemnye shakht diya vydachi razubozhennykh rud)

PERIODICAL: Gornyy zhurnal, 1958, Nr 3, pp 69 - 71 (USSR)

ABSTRACT: The question of delivery of poor ore from the mines for concentration processing still is not yet solved. As the skip hoists are overloaded with rich ores, the delivery of poor ores is sometimes carried out through the ventilation shafts. It creates great inconveniences to the workers and often causes the collision of delivering cars. The author proposes the construction of a special bunker for the poor ore connected with the dosing chamber. The filling of the dosator could be effected by a conveyor belt. This method was tried out on the Novaya mine of the Mine Administration imeni Rosa Luksemburg and the Kapitalnaya mine of the Degtyarka Mine Administration and gave satisfactory results. There are 3 figures.

TITLE: Klimat-4 ship air conditioner

SOURCE: Kholodil'naya tekhnika, no. 6, 1965, 5-8

TOPIC TAGS: air conditioning equipment, refrigeration equipment

ABSTRACT: The Klimat-4 air conditioner is designed for year-round operation on vessels not equipped with central air conditioning systems. It controls both temperature and relative humidity and can move 1500 m³ of air an hour. The Klimat-4 consists of a cooling unit, air heater, humidifier, fan, and automatic regulator system; freon-22 is used as a coolant. A detailed breakdown of the technical parameters and a description of each component of the air conditioner are given. It is recommended for use on ships and in hospitals, kindergartens, cafes, and restaurants. Orig. art. has: 2 figures, 2 tables.

TITLE: Derivatives of trichlorophosphazofluoroacyls [29]

SOURCE: Zhurnal obshchey khimii, v. 35, no. 3, 1965, 532-534

TOPIC TAGS: organic azo compound, phosphorus chloride amide, fluorinated organic compound, hydrolysis, chlorinated organic compound, ester

ABSTRACT: Reaction of phosphorus pentachloride with amides of o-, m-, and p-fluorobenzoic acids proceeded according to the phosphazone reaction scheme, producing the corresponding trichlorophosphazofluorobenzoyls. These are low melting crystalline substances, with chemical properties close to those of trichlorophosphazobenzoyls. Subsequent hydrolysis of the trichlorophosphazofluorobenzoyls yielded dichlorides of fluorobenzoylamidophosphoric acids and the free fluorobenzoylamidophosphoric acids. Reaction of the dichlorides of fluorobenzoylamidophosphoric acids with alcohols and sodium phenolate produced the corresponding diesters of fluorobenzoylamidophosphoric acids. Diphenyl esters of fluoroaroylamidophosphoric acids are also produced in good yield by the action of phenol on trichlorophosphazofluoroaroyls, followed by hydrolysis with water or with 2N sodium hydroxide. TITLE: Mixed diesters of urethanephosphoric acids	1
SOURCE: Zhurnal obshchey khimii, v. 35, no. 12, 1965, 2220-2222	
TOPIC TAGS: insecticide, organic phosphorus compound, ester phosphoric acid, vacuum distillation, organic isocyanate compound	
ABSTRACT: Certain diesters of urethanephosphoric acids with identical substituents on the phosphorus atom possess strong <u>insecticidal</u> action. The dimethyl ester of methylurethanephosphoric acid (K-20-30) and the dimethyl ester of isopropylurethanephosphoric acid (avenin) are effective systemic insecticides against the garden beet weevil. In contrast to other organophosphorus insecticides they do not possess the properties of cholinesterase inhibitors and are absolutely harmless to warm-blooded animals. The mixed diesters of urethanephosphoric acids were unknown up to this time. The diesters of urethanephosphoric acids with identical substituents on the phosphorus atom are readily obtained by the reaction of alcoholates or absolute alcohols and the acid dichlorides of urethanephosphoric acids. To obtain the diesters of urethanephosphoric acids with different substituents on the phosphorus atom, the reaction between the acid

ACC NR: AP6016704

dichlorides and alcohols is conducted in the presence of triethylamine in two states:

A total of 18 mixed diesters were obtained and characterized including those derived from the higher ($\text{C}_6\text{-C}_{10}$) alcohols.

The mixed diesters of urethanephosphoric acids upon being distilled in a vacuum (7-10 mm) cleave off quantitatively the alcohols and are converted into the diesters of isocyanatophosphoric acid:

The diesters of isocyanatophosphoric acid react vigorously with aromatic amines to form N-phosphono-N'-arylureas:

TITLE:

The Regeneration of Metanitrobenzoic Acid in the Electrolyte at
Lead Extraction from Waste
*Cpredelenije metanitrobenzoyne
pri vyelektrolyze pri svashchi sloboda v otrichiv.*

PERIODICAL:

Zavodskaja Laboratoriya, 1957, Vol. 23, No. 12, pp. 1430-1432 (USSR)

ABSTRACT:

For the regeneration of lead from waste products an electrolytical method is used (in the USSR), in which a 5% solution of NaOH with 2,5% of the metanitrobenzoic acid serves as an electrolyte. As in this case the disturbing influence of this electrolyte must be taken into account, the endeavor is made in this paper to find the most satisfactory form of employing the method mentioned. For this purpose it is recommended that the oxidizing-regenerating reaction between bivalent lead and metanitrobenzoic acid be carried out quantitatively in the basic medium. The comparatively larger dose of the solution of bivalent lead salt is here added to the lye solution. After the end of the reaction the lead is de-titrated in the acid medium by iodine. In order to be able to secure a quantitative development of the reaction, the solution is heated up to 90-95°. In order to avoid reaction with the air, the operations are carried out in

Cont 1/2

The Determination of Metanitrobenzoic Acid in the Electrolyte
at Lead Extraction from Waste

J2-12-12/71

This case is a hydrogen atmosphere, and the hydrochloric acid solution of SnCl_2 must be preserved under the shelter of this atmosphere. In order to replace the air in the titration retort, it is recommended first to fill the retort with water and then to introduce the hydrogen into the retort through the bent glass tube in the cork, by which the water is forced out of the retort. Otherwise, hydrogen must pass through the retort continuously. The analysis is described. Results are shown in 2 tables. There are 2 tables and 4 Slavic references.
